🔎 PART 1 — Become an NLP Detective

Look at the apps and technologies you personally use.

Choose **3 technologies or applications** from the list below, or find your own:

- ChatGPT
- Google Search
- Siri
- Facebook/Messenger
- TikTok
- YouTube
- Gmail
- Grammarly
- Google Maps
- Voice typing
- Alexa
- Online shopping apps
- Chatbots
- Spam filter

For each one, answer:

1. What application did you choose?
2. How does it use or interact with human language?
3. What does the computer seem to understand from the user's words?
4. Give one example of something you can type or say to it.

> Example:
>
> **Application:** Google Translate
> **How it uses language:** It translates one language into another.
> **What it understands:** It identifies the words and language being used.
> **Example:** "Good morning" → "Magandang umaga."

🔎 PART 2 — Can a Computer Understand This?

Imagine you are designing a computer that can understand human language.

Read the following statements:

A. "I'm dying of laughter"

B. "Nice. Another Monday."

C. "The food was fire!"

D. "Can you pass me the charger?"

E. "It's cold in here."

For **each statement**, answer:

1. What do you think the person **really means**?
2. Would a computer easily understand it? **Yes / No / Maybe**
3. Why?

There are **no wrong answers** in this part. Explain your reasoning.

⚜ PART 3 — You Are the Computer

Pretend that you are a computer receiving this message:

"**Hey! Can you recommend a good restaurant near me? I'm starving.**"

Break the message into information that a computer might need.

Complete:

Person's request: _____

Important words: _____

Possible location: _____

What does "I'm starving" mean?

What should the computer do?

⋆ Challenge

What if the user says:

"Find me somewhere cheap but good."

What does "**cheap**" mean?

What does "**good**" mean?

Why might this be difficult for a computer?

💬 PART 4 — Human vs. Computer

Answer briefly:

1. Why do humans understand sentences more easily than computers?
2. Give one example of a sentence that could have **two different meanings**.
3. Give one example of **slang, shortcut, emoji, or internet language** that might confuse a computer.
4. Do you think computers can truly understand human language?

Explain your answer in **2–3 sentences**.

💡 PART 5 — Your NLP Idea

Imagine that your school wants to create an **AI-powered student assistant**.

What language-related problem could it solve?

Your idea:

Name of your AI assistant:

Problem it will solve:

What students can say/type to it:

What the AI should do:

Why would this be useful?

🖊 PART 6 — One-Sentence Challenge

Finish this sentence **in your own words**:

"For me, Natural Language Processing might be..."

Write **only one sentence**.

Don't search for the definition of NLP yet. **Use your own understanding.**

Find **one example of AI interacting with human language** on your phone today.

Take a screenshot **or describe what happened**.

Then answer:

What did the AI receive?

What did it do with the language?

Did it understand you correctly?

If it misunderstood you, what went wrong?

📌 Submission Guidelines

- **Individual work**
- You may use your phone/internet to **observe and investigate examples**.
- Do **not** copy a definition of NLP from Google or AI.
- Answers should be based on **your own observations and reasoning**.
- Keep your answers clear and concise.
- **Recommended length:** 1–2 pages
- Be prepared to share **your answers** during our first lecture.
- Google Drive link will be provided in the group chat for the submission of softcopy (PDF format).
